

Self-Attention encodes a sequence into a form that accounts for the other respective data in the sequence

\* each element in new form is aware of surrounding data

1.

$$W = [K_{n \times m}, V_{n \times m}, Q_{n \times m}]$$

$n \Rightarrow$  input dim  
 $m \Rightarrow$  output dim

Ex:  $\begin{bmatrix} \text{Input 1} \\ \text{Input 2} \end{bmatrix}_{2 \times n} K_{n \times m} = \begin{bmatrix} k_1, (1xm) \\ k_2, (1xm) \end{bmatrix}_{2 \times m}$

$\begin{bmatrix} \text{Input 1} \\ \text{Input 2} \end{bmatrix}_{2 \times n} V_{n \times m} = \begin{bmatrix} v_1 \\ v_2 \end{bmatrix}_{2 \times m}$

$\begin{bmatrix} \text{Input 1} \\ \text{Input 2} \end{bmatrix}_{2 \times n} Q_{n \times m} = \begin{bmatrix} q_1 \\ q_2 \end{bmatrix}_{2 \times m}$

2. Repeat for each input

For Input 1:

(A)

$$S_{1,m} = Q_1 k_1^T$$

$$S_{2,m} = Q_1 k_2^T$$

$$\hat{S}_1 = \begin{bmatrix} s_{1,1} \\ s_{1,2} \end{bmatrix}$$

(B)

$$\text{softmax}(S_1) \rightarrow \hat{S}_1$$

(C)

$$\hat{v}_1 = v_1 \odot \hat{S}_1$$

$$\hat{v}_2 = v_2 \odot \hat{S}_2$$

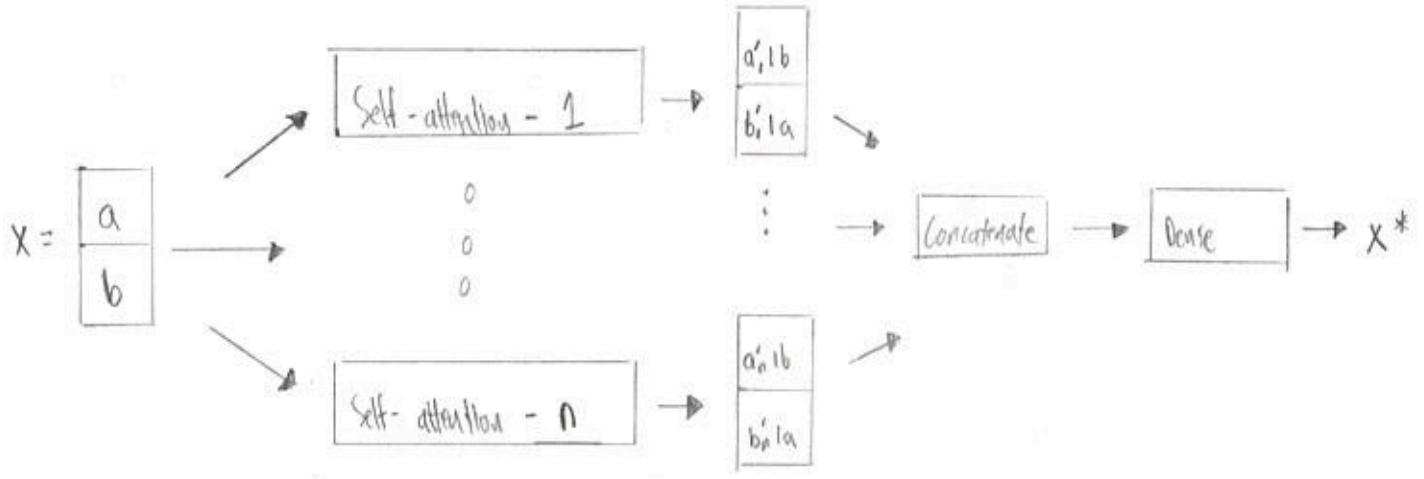

(D)

$$\text{Output 1}_{(1xm)} = \sum_{i=1}^2 \hat{v}_i$$

3.

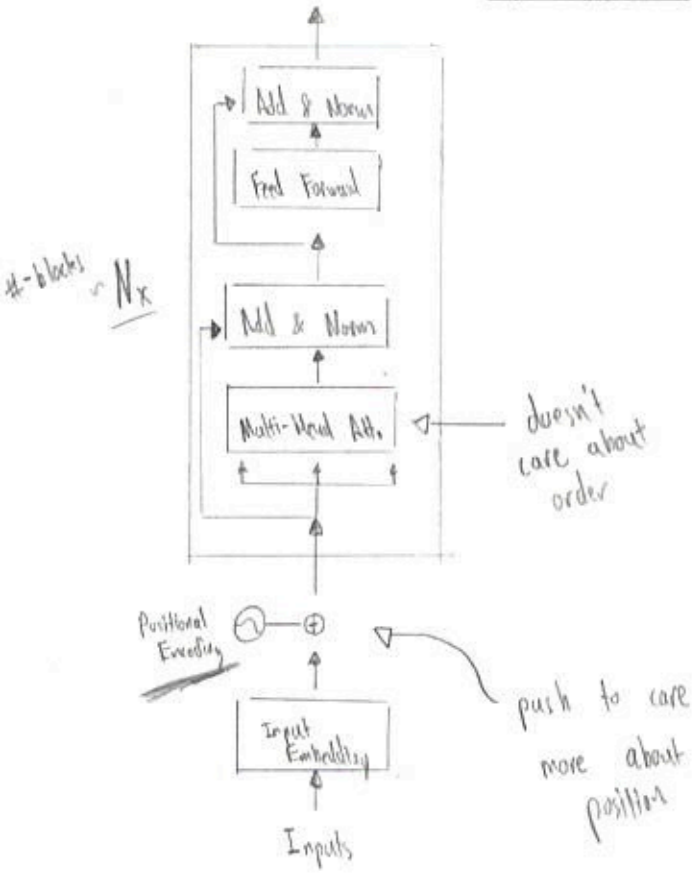

# Multi-head attention

# Transformers

## Encoder

## Recurrent Network vs MH-attention

- ~ RN can't be parallelized, MH-att can
- ~ RN not numerically stable
